

Fiber Blue™

Make more money and better concrete

Reduce cracks. Reduce quality issues.

Because the fibers in Fiber Blue reduce cracks by up to 75%, there are fewer quality issues later. Customers are less likely to complain and building code approvals are easier.

Fiber Blue attacks cracks.

Fiber Blue is designed to attack cracks. Every cubic metre of Fiber Blue concrete contains millions of high-tensile microfilaments, which act as an intricately woven matrix to stop cracking by as much as 75%. Fibers are distributed evenly throughout the mix, intersecting minute cracks which form on or below the surface. By stopping cracks during the setting process, Fiber Blue ready-mixed concrete makes sure they don't become large cracks later.
