

ST MARYS **Portland Lime**

**What keeps it together . . .
is what sets us apart.**

It's all about working together.

The best guarantee of a good masonry project is a good mason and good masons appreciate good materials. St Marys Portland Lime cement is a special formulation of St Marys Portland cement and double hydrated Type S lime. Available in two mortar classes (Type N & Type S) it can be used for load-bearing masonry above or below grade. St Marys Portland Lime cement produces a creamy mortar with excellent workability that is especially useful in matching the look and feel of traditional Portland and lime mortar.

Is consistency important? Ask your architect.

St Marys Portland Lime cements are preblended under controlled conditions to ensure exact proportions that meet CSA A179 and ASTM C270 specifications. The contractor need only add the appropriate amount of sand and water. Preblending is an important quality control benefit that ensures the proper amounts of Portland cement and lime are used with every batch. This produces a homogenous mix, eliminating variations in strength and colour that site blending may cause. With St Marys Portland Lime cement, it is easier to maintain consistency from batch to batch.

Traditional mortars for historic buildings.

Higher Portland cement contents contribute to excellent bond strength development, which is especially suited to natural stone or manufactured stone applications. Lime adds to the workability and lightens the mortar colour, making St Marys Portland Lime ideal for matching older buildings originally constructed with a Portland and lime mortar.

Type N
(30 Kg Bag)

- 1 part Type N Portland Lime
- 3 parts damp loose brick sand
- enough water for the desired workability

Type S
(34 Kg Bag)

- 1 part Type S Portland Lime
- 3 parts damp loose brick sand
- enough water for the desired workability
